

Synthetic clozapine monitoring protocol with image evidence

Synthetic test document for RAG demonstration only. Not a clinical guideline and not medical advice.

Clozapine safety checkpoints

- This synthetic document emphasises FBC/ANC monitoring, myocarditis symptom screening, metabolic monitoring, constipation prevention, and shared-care communication.
- A source answer should mention that fever, chest pain, dyspnoea, tachycardia, marked sedation, seizures, or severe constipation require urgent review.
- The test corpus deliberately includes a table image so image captions become searchable evidence.

High yield monitoring items

- Baseline: FBC/ANC, ECG if indicated, troponin/CRP if local protocol requires, weight, waist, lipids, glucose/HbA1c, smoking status, bowel history, and medicine reconciliation.
- Early treatment: weekly blood monitoring in the synthetic example, plus myocarditis and constipation checks during the initiation period.
- Ongoing: metabolic review, clozapine level when clinically indicated, adherence review, and rapid source navigation to the prescribing document.

Embedded image evidence

The raster image below should be extracted by the worker, uploaded to Supabase Storage, captioned by the vision model, and inserted into searchable chunk context.

Synthetic clozapine monitoring table

Domain	Baseline	Initiation	Ongoing
FBC / ANC	confirm	weekly	per protocol
Myocarditis	symptoms	CRP/troponin	if symptomatic
Metabolic	weight/lipids	weight	scheduled
Constipation	bowel history	active plan	review
