

Synthetic acute risk triage flow with image evidence

Synthetic test document for RAG demonstration only. Not a clinical guideline and not medical advice.

Acute risk assessment flow

- The synthetic WA-style triage flow separates immediate safety, mental state, substance use, supports, means restriction, protective factors, and follow-up plan.
- Questions about urgent escalation should retrieve the risk flowchart image and the text page describing same-day senior review triggers.
- Do not use this sample as a real emergency policy; it exists to test image-aware retrieval and citations.

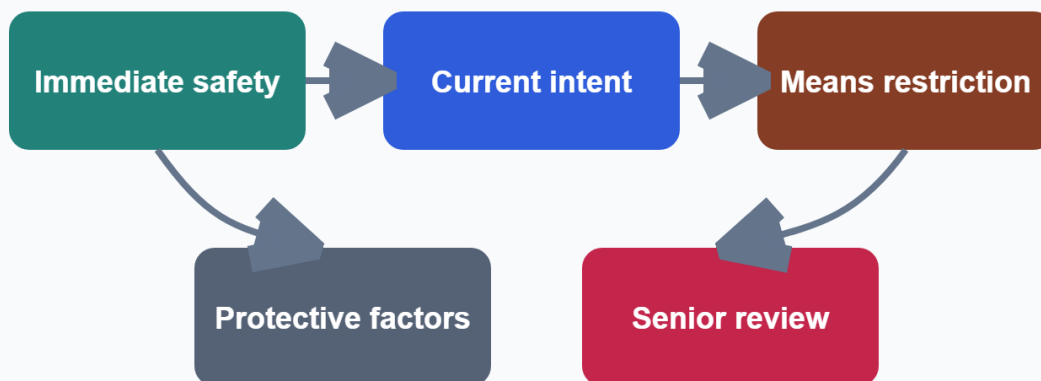

Escalation triggers

- Escalate in this test document for current intent, recent attempt, command hallucinations, severe agitation, intoxication with unsafe behaviour, inability to collaborate on safety planning, or absent supervision.
- The document viewer should link the answer citation to the page containing these triggers.

Embedded image evidence

The raster image below should be extracted by the worker, uploaded to Supabase Storage, captioned by the vision model, and inserted into searchable chunk context.

Synthetic acute risk triage flow

Use citations to jump from answer to page and chunk. Synthetic test data only.
