

WORK INSTRUCTION

Progressive Risk Monitoring

Scope (Staff):	Clinical Staff
Scope (Area):	Ward 5A

This document should be read in conjunction with this [disclaimer](#)

Purpose

To assist clinicians to monitor and document progressive risk and ensuring currency of management plans.

Definitions

Low risk - Minimal evidence to indicate immediate concern

Moderate risk - Requires monitoring and action to minimise risk

High risk - Definite risk factors that require immediate attention

Equipment

- The Progressive Risk Assessment is a tool which captures risk at a particular time and supports staff to escalate a patient's care if deterioration in mental state or an increase in risk is identified. It also supports staff to ensure risk is tracked throughout a patient's admission to provide health professionals with a visual guide to further understand changes in the patient's level of risk while an inpatient.

Instructions

- This work instruction must be read in conjunction with the [CAMHS Risk Assessment and Management policy](#) and the [CAMHS Clinical Assessment policy](#).

Steps
What domains are included in a progressive risk assessment • Harm to self • Harm to others • Harm from others • Impulsivity • Absconding • Alcohol and Drugs Each domain must be assessed for risk as being either low, moderate or high. Identifying the level of risk can be supported by the Descriptors on the front page of the tool.
Timing of progressive risk assessments A Progressive Risk Assessment must be completed at the conclusion of every nursing shift, i.e., morning, afternoon and night shift. It is the Shift Coordinators responsibility to ensure that all the PRAs are completed each shift. The rating is a clinical assessment of the patient's risk over the course of the shift. The Progressive Risk Assessment is not a replacement for a Risk Assessment and Management Plan (RAMP) and both may need to be completed when indicated by the Progressive Risk Assessment or the CAMHS Risk Assessment and Management policy.
Completing the progressive risk assessment tool The risk rating is indicated on the form by placing a dot in the centre of the box corresponding to the shift day and time and risk rating (low, moderate, and high) on page 2 of the tool. Over the course of the admission, the rating dots can be joined to graphically display changes in risk throughout a patient's admission. See appendix 3 for an example. Hard copies are available on the unit.
Communication Increases in risk status or the identification of ongoing high risk and accompanying plan must be communicated to the shift co-ordinator and if appropriate, escalated to a medical professional.

Sections that must be included on the document

- Level of observations at the time of assessment
- Date and time
- Completion of RAMP, PSOLIS plan, ICSP or escalation to shift co-ordinator and/or doctor
- Interventions and/or rationale in response to level of risk
- Designation and signature of clinician completing the assessment
